

UrbanCart Marketing Campaign Performance Report

Prepared for: Management & Client Stakeholders

Company: UrbanCart

Project: Marketing Campaign Performance Analytics

Reporting Period: January 2024 – December 2025

Prepared by: Tejaswi Aluka

Analytics Platform: Microsoft Power BI

1. Executive Summary

UrbanCart is a fictional Australian retail business operating marketing campaigns across multiple channels, including paid media and Email. This report presents an analysis of UrbanCart's marketing campaign performance for the period January 2024 to December 2025.

The analysis was developed using Power BI, Power Query and DAX and covers marketing investment, attributed revenue, campaign performance, customer acquisition, marketing funnel performance, channel effectiveness, customer segments, devices and geography.

Across the full Campaign Performance view, UrbanCart generated **\$241.36M in attributed revenue from \$130.97M in marketing spend**, resulting in an overall **ROAS of 1.84x** and **ROI of 84.29%**. The analysis also records **2,168,828 conversions** at an overall **CPA of \$60.39**.

The results indicate that UrbanCart has achieved s

ubstantial marketing scale. However, revenue and marketing spend have increased at broadly similar rates, while ROAS has remained relatively stable. This means that increasing marketing investment alone may not necessarily improve efficiency.

The marketing funnel also identifies a significant gap between lead generation and conversion. UrbanCart generated approximately **33.12M leads** compared with approximately **2.17M conversions**, resulting in a Lead-to-Conversion Rate of approximately **6.55%**.

Email is a significant contributor to reported conversion activity, with the highest visible CTR of **8.62%** and channel conversion rate of **1.81%**. However, attributed performance should be distinguished from incremental performance before using channel-level results to make major budget decisions.

Customer analysis further shows that approximately **62% of reported conversions are associated with Returning, Loyal and At-Risk customers**, demonstrating that UrbanCart's marketing performance is not solely driven by new customer acquisition.

Overall, the analysis provides management with a framework for evaluating marketing performance using multiple metrics rather than relying on revenue or conversion volume alone.

2. Business Objective

The primary objective of the UrbanCart Marketing Campaign Performance project was to develop a reliable and auditable Power BI solution that enables management to understand:

- Marketing investment and attributed revenue.
- Campaign-level financial performance.
- Marketing efficiency.
- Customer acquisition performance.
- Marketing funnel progression.
- Channel effectiveness.
- Customer segment performance.
- Geographic and device-level performance.
- Data-quality limitations affecting marketing KPIs.

The analysis specifically evaluates:

- Spend
- Revenue
- ROAS
- ROI
- CPA
- CPC
- CTR
- Conversion Rate
- Leads
- Conversions

- New Customers
-

3. Reporting Scope

The analysis covers the period:

January 2024 – December 2025

The underlying project uses a synthetic UrbanCart marketing dataset containing campaign, customer, channel, geography, funnel and financial information.

The final Campaign Performance view contains **25 campaign names**.

The analysis is designed around campaign marketing activity and does not represent actual commercial performance of a real organisation.

4. Analytical Approach

The project followed an end-to-end analytics workflow:

1. Raw data inspection.
2. Data-quality profiling.
3. Missing-value investigation.
4. Duplicate investigation.
5. Text standardisation.
6. Business-rule validation.
7. Creation of cleaned analytical fields.
8. Development of fact and dimension tables.
9. Power BI data modelling.
10. DAX KPI development.
11. Dashboard development.
12. Business interpretation.

A key principle throughout the project was to preserve source information while creating separate analytical fields for validated calculations.

For example:

- Clicks represents the source value.

- Clean_Clicks represents the value used for analytical calculations.

This approach improves auditability and prevents source information from being silently overwritten.

5. Data Quality Assessment

Data quality was assessed before interpreting financial and marketing performance metrics.

5.1 Duplicate Records

150 duplicate records were identified.

Duplicates were investigated using the working business grain:

Campaign_ID + Campaign_Date + Channel_ID + State + City + Customer_ID

Records were compared across marketing and financial fields before removal.

The validated duplicate records were removed from the analytical dataset.

5.2 Missing Spend

The project identified **220 missing Spend values**.

Missing Spend was not automatically converted to zero because a null financial value may represent missing cost information rather than zero expenditure.

This distinction is important because replacing missing Spend with zero could artificially improve ROAS, ROI and other efficiency metrics.

5.3 Missing Revenue

The project identified **150 missing Revenue values**.

Revenue was retained as null where the available information was insufficient to confirm that the correct business interpretation was zero revenue.

The analysis identified that **142 of the records with missing Revenue had recorded conversions**, indicating that the missing values could not safely be treated as zero without further business confirmation.

5.4 Funnel Validation

The following business rules were applied:

Validation Rule	Reported Issue
Clicks $\leq$ Impressions	35 violations
Conversions $\leq$ Clicks	20 violations
Leads $\leq$ Clicks	0 violations
Spend $\geq$ 0	20 negative values reported
Email Opens $\leq$ Email Sent	0 violations
Email Clicks $\leq$ Email Opens	0 violations

Invalid numerical values were flagged and cleaned analytical fields were created where appropriate.

6. Data Model

The Power BI solution uses a fact-and-dimension model.

Fact Table

Fact_Marketing

The fact table contains campaign activity and analytical measures including:

- Campaign
- Date
- Channel
- Geography
- Customer
- Customer Segment
- Device
- Impressions
- Clicks
- Leads
- Conversions
- Spend
- Revenue
- New Customers

- Email metrics
- Data-quality fields
- Clean analytical fields

Dimension Tables

The model includes:

- Dim_Date
- Dim_Campaign
- Dim_Channel
- Dim_Geography

Mapping tables are used during the Power Query standardisation process for channel and customer segment values.

The model uses one-to-many relationships from dimensions to the fact table with single-direction filtering.

7. KPI Framework

The project evaluates marketing performance using multiple complementary KPIs.

KPI	Definition	Purpose
Spend	Sum of validated marketing spend	Measures investment
Revenue	Sum of validated attributed revenue	Measures attributed business outcome
CTR	Clicks / Impressions	Measures engagement
Conversion Rate	Conversions / Clicks	Measures post-click effectiveness
CPC	Spend / Clicks	Measures traffic acquisition cost
CPA	Spend / Conversions	Measures conversion acquisition cost
ROAS	Revenue / Spend	Measures revenue generated per dollar spent
ROI	(Revenue - Spend) / Spend	Measures return after marketing spend
New Customers	Sum of New Customers	Measures acquisition volume

8. Overall Marketing Performance

The full Campaign Performance view reports:

Metric	Result
Total Spend	\$130.97M
Total Revenue	\$241.36M
ROAS	1.84x
Total Conversions	2,168,828
CPA	\$60.39
ROI	84.29%

These values represent the full Campaign Performance view and may differ from values displayed when dashboard filters are applied.

9. Revenue and Marketing Investment

UrbanCart generated approximately **\$241.36M in attributed revenue** from approximately **\$130.97M in marketing spend**.

The resulting **1.84x ROAS** means that the dataset attributes approximately \$1.84 in revenue for every \$1 of marketing spend.

The analysis also shows that revenue and marketing spend have both almost doubled compared with the previous period, while ROAS changed only slightly from **1.86x to 1.84x**.

Business interpretation

UrbanCart has demonstrated the ability to scale marketing investment and attributed revenue. However, the relatively stable ROAS indicates that increased spend has not produced a material improvement in aggregate revenue efficiency.

This does not by itself establish that additional investment should or should not occur. Further analysis of incremental revenue, contribution margin and customer lifetime value would be required to evaluate the economics of additional investment.

10. Campaign Performance

Campaign-level performance was evaluated using revenue, spend, ROAS, ROI, conversions and CPA.

Payday Promotion

Payday Promotion generated approximately:

- **90.8K conversions**
- **\$10.17M revenue**
- **\$5.54M spend**
- **1.83x ROAS**

The campaign is therefore a significant volume contributor while its ROAS is close to the overall portfolio ROAS of 1.84x.

Management consideration

Conversion volume alone should not be used to assess campaign efficiency.

Further analysis should consider:

- New-customer acquisition.
- Average order value.
- Gross margin.
- Repeat purchase behaviour.
- Customer lifetime value.

This would help distinguish short-term promotional volume from longer-term customer value.

11. Funnel Performance

The marketing funnel analysed in the dashboard is:

Impressions → Clicks → Leads → Conversions

The analysis identified approximately:

- **33.12M Leads**
- **2.17M Conversions**

The resulting Lead-to-Conversion Rate is approximately:

6.55%

This means approximately **93.45% of reported leads do not progress to conversion** within the measured funnel.

Business interpretation

The funnel indicates a substantial difference between lead generation and conversion.

This creates an area for investigation around:

- Lead quality.
- Follow-up timing.
- Offer relevance.
- Landing-page experience.
- Remarketing.
- Checkout or purchase friction.

The result should be interpreted as a diagnostic signal rather than proof that one particular factor is responsible for the observed drop-off.

12. Channel Performance

Channel-level analysis evaluates:

- CTR.
- Conversion Rate.
- Leads.
- Conversions.
- Revenue.
- Spend.

Email

Email records the highest visible:

- **CTR: 8.62%**
- **Conversion Rate: 1.81%**

Email also contributes approximately **1.04M conversions**, representing nearly half of total reported conversions.

Business interpretation

Email is an important contributor to reported marketing performance in the dataset.

However, attribution does not necessarily equal incremental impact.

Customers who receive marketing emails may have purchased even without the email intervention.

Therefore, before making significant budget or resource changes based solely on Email attribution, management should consider controlled testing or other incremental measurement approaches.

13. Customer Analysis

Customer analysis shows the following conversion distribution:

Customer Type	Conversions	Share
New Customers	823K	38.26%
Returning Customers	759K	35.30%
Loyal Customers	355K	16.51%
At-Risk Customers	214K	9.93%

Approximately **62% of conversions are associated with Returning, Loyal and At-Risk customers combined.**

Business interpretation

The marketing programme is not solely acquisition-driven.

A substantial proportion of reported conversion activity comes from customers who already have a relationship with UrbanCart.

Management reporting should therefore distinguish between:

New Customer Acquisition

and

Retention / Reactivation

because the economics, objectives and appropriate KPIs can differ between these activities.

14. Geographic and Device Analysis

The Power BI solution also provides analysis by:

- State.
- City.
- Device.
- Customer segment.

The purpose is to identify differences in engagement and conversion behaviour across customer and geographic groups.

Device-level analysis includes conversion rate comparisons, while geographic analysis examines conversion and revenue contribution.

These views should be used to identify areas for further investigation rather than treating historical differences as evidence of guaranteed future performance.

15. Key Findings

Finding 1 — Marketing has achieved significant scale

UrbanCart generated **\$241.36M in attributed revenue** from **\$130.97M in marketing spend**, producing **1.84x ROAS**.

Revenue and spend have both increased substantially while aggregate ROAS has remained broadly stable.

Finding 2 — Conversion volume and efficiency should be considered together

Payday Promotion generated approximately **90.8K conversions**, but its **1.83x ROAS** was close to the overall portfolio ROAS.

This illustrates why conversion volume alone is insufficient for assessing marketing efficiency.

Finding 3 — The lead-to-conversion stage warrants investigation

The dataset reports approximately **33.12M leads** and **2.17M conversions**, producing a Lead-to-Conversion Rate of approximately **6.55%**.

This indicates a large measured drop-off between lead generation and conversion.

Finding 4 — Email is an important attributed conversion channel

Email has a reported CTR of **8.62%**, a conversion rate of **1.81%** and approximately **1.04M conversions**.

However, further incremental measurement is required to determine how much of the attributed performance is caused by Email activity.

Finding 5 — Existing customers contribute substantial conversion volume

Approximately **62% of conversions** are associated with Returning, Loyal and At-Risk customers.

This supports separating acquisition reporting from retention and reactivation reporting.

16. Management Recommendations

16.1 Evaluate Campaigns Using Multiple KPIs

Management should evaluate campaigns using a combination of:

- Revenue.
- Spend.
- ROAS.
- ROI.
- CPA.
- CPC.
- Conversion Rate.
- Conversion volume.
- New Customers.

No single KPI provides a complete view of campaign performance.

16.2 Investigate High-Efficiency Historical Campaigns

New Product Launch and **EOFY Deals** showed strong historical ROAS and relatively low CPA in the analysed data.

Management can investigate their:

- Audience.
- Offer.
- Channel mix.
- Timing.
- Creative approach.

Historical performance should be treated as evidence for further testing rather than as a guarantee of future performance.

16.3 Analyse High-Volume Campaigns Separately

Campaigns such as:

- Payday Promotion.
- Tech Upgrade.
- Refer a Friend.
- Black Friday.

generated high conversion volumes.

These campaigns should be evaluated separately for scale, efficiency and customer value.

16.4 Investigate Lower-Efficiency Campaigns

VIP Customer Offer can be investigated further to understand whether differences in:

- Audience.
- Offer.
- Channel mix.
- Timing.
- Acquisition cost.

contributed to its comparatively lower historical ROAS.

16.5 Improve Lead-to-Conversion Measurement

The significant Lead-to-Conversion gap warrants additional analysis.

Recommended areas include:

- Lead quality.
- Lead scoring.
- Follow-up speed.
- Offer relevance.

- Landing-page experience.
 - Remarketing.
 - Checkout experience.
-

16.6 Separate Acquisition and Retention Reporting

Because a substantial proportion of conversion activity comes from existing customers, management should report acquisition and retention/reactivation separately.

Recommended measures include:

Acquisition

- New Customers.
- Cost per New Customer.
- New Customer Revenue.
- New Customer ROAS.
- Customer acquisition cost.

Retention / Reactivation

- Returning Customer Revenue.
 - Repeat Purchase Rate.
 - Reactivation Rate.
 - Customer Lifetime Value.
 - Retention revenue.
-

16.7 Strengthen Incrementality Measurement

Channel attribution should not automatically be interpreted as incremental revenue.

For channels such as Email, management could use:

- Holdout groups.
- A/B testing.
- Geo-based experiments.
- Incrementality testing.

This would help determine the additional business value generated by marketing activity.

17. Data Limitations

The following limitations should be considered when interpreting the analysis.

Attribution

Revenue is attributed to marketing activity in the dataset. Attribution does not necessarily demonstrate incremental revenue.

Financial Data

Missing Spend and Revenue values exist in the source data.

Data Quality

Some source records contain invalid funnel relationships, such as Clicks greater than Impressions and Conversions greater than Clicks.

Margin

The analysis uses Revenue and Spend but does not include product gross margin or contribution margin.

Therefore, ROI should not be interpreted as a complete business profitability measure.

Customer Lifetime Value

The available data does not establish complete customer lifetime value.

Historical Analysis

Historical campaign performance should be used as evidence for future testing rather than treated as a guarantee of future results.

18. Dashboard Deliverables

The Power BI solution contains the following analytical views.

Marketing Performance Overview

Provides:

- Total Spend.
- Total Revenue.

- ROAS.
- Total Leads.
- Total Conversions.
- Conversion Rate.
- Revenue and Spend trends.
- ROAS trend.
- Monthly conversion performance.

Marketing Funnel

Provides:

Impressions → Clicks → Leads → Conversions

Including:

- Funnel volume.
- CTR.
- Lead Rate.
- Lead-to-Conversion Rate.
- Funnel drop-off.
- Funnel trends.

Campaign Performance

Provides:

- Spend.
- Revenue.
- ROAS.
- ROI.
- Conversions.
- CPA.
- Campaign comparison.

Channel and Customer Analysis

Provides:

- CTR by Channel.
 - Conversion Rate by Channel.
 - Leads and Conversions by Channel.
 - Conversions by Customer Segment.
 - Conversion Rate by Device.
 - Conversions by Geography.
-

19. Conclusion

The UrbanCart Marketing Campaign Performance analysis provides management with a structured view of marketing investment, attributed revenue, acquisition efficiency and funnel performance.

The overall dataset reports:

\$130.97M marketing spend → \$241.36M attributed revenue → 1.84x ROAS

The analysis demonstrates that UrbanCart has achieved significant marketing scale, but aggregate efficiency has remained broadly stable.

The largest areas for further investigation are:

1. Lead-to-conversion performance.
2. Incremental impact of Email and other attributed channels.
3. New customer acquisition versus retention economics.
4. Customer lifetime value.
5. Campaign-level efficiency and scalability.
6. The impact of gross margin on true marketing profitability.
7. Data-quality issues affecting financial and funnel metrics.

The Power BI solution provides a foundation for these investigations while maintaining a clear distinction between source data, cleaned analytical values and business interpretation.

20. Final Management Summary

Area	Key Result
Marketing Spend	\$130.97M
Attributed Revenue	\$241.36M
ROAS	1.84x
ROI	1
Conversions	\$2,168,828.00
CPA	\$60.39
Leads	33.12M
Lead-to-Conversion Rate	6.55%
Email CTR	8.62%
Email Conversion Rate	1.81%
Email Conversions	~1.04M
New Customer Conversion Share	38.26%
Existing/Other Customer Conversion Share	~61.74%

Overall conclusion

UrbanCart's marketing programme demonstrates substantial scale and attributed revenue generation. The analysis also shows that improving marketing outcomes requires more than increasing spend or maximising conversion volume.

Future performance management should combine **financial efficiency, customer acquisition, retention, funnel performance, incrementality and data quality** to provide a more complete view of marketing effectiveness.

Disclaimer

UrbanCart is a fictional company created for portfolio and learning purposes. The dataset is synthetic and does not represent actual UrbanCart business performance.

The analysis and recommendations are based on the available historical dataset and should be validated against additional financial, customer, attribution and operational information before being used for real-world business decisions.
